

Setup My FMS

Radiology iPad App

Anyone in the dental field, including dentists, dental students, hygienists and assistants must learn the skill of organizing intra-oral radiographs in order to provide a reliable image series that can be used for diagnostic purposes. A full mouth series of radiographs is composed of 18 to 20 individual images. These images must be setup in the correct orientation, a skill which requires anatomical knowledge, as well as the ability to discern left from right and maxilla from mandible on the radiographs. This is like a puzzle in which the pieces can be

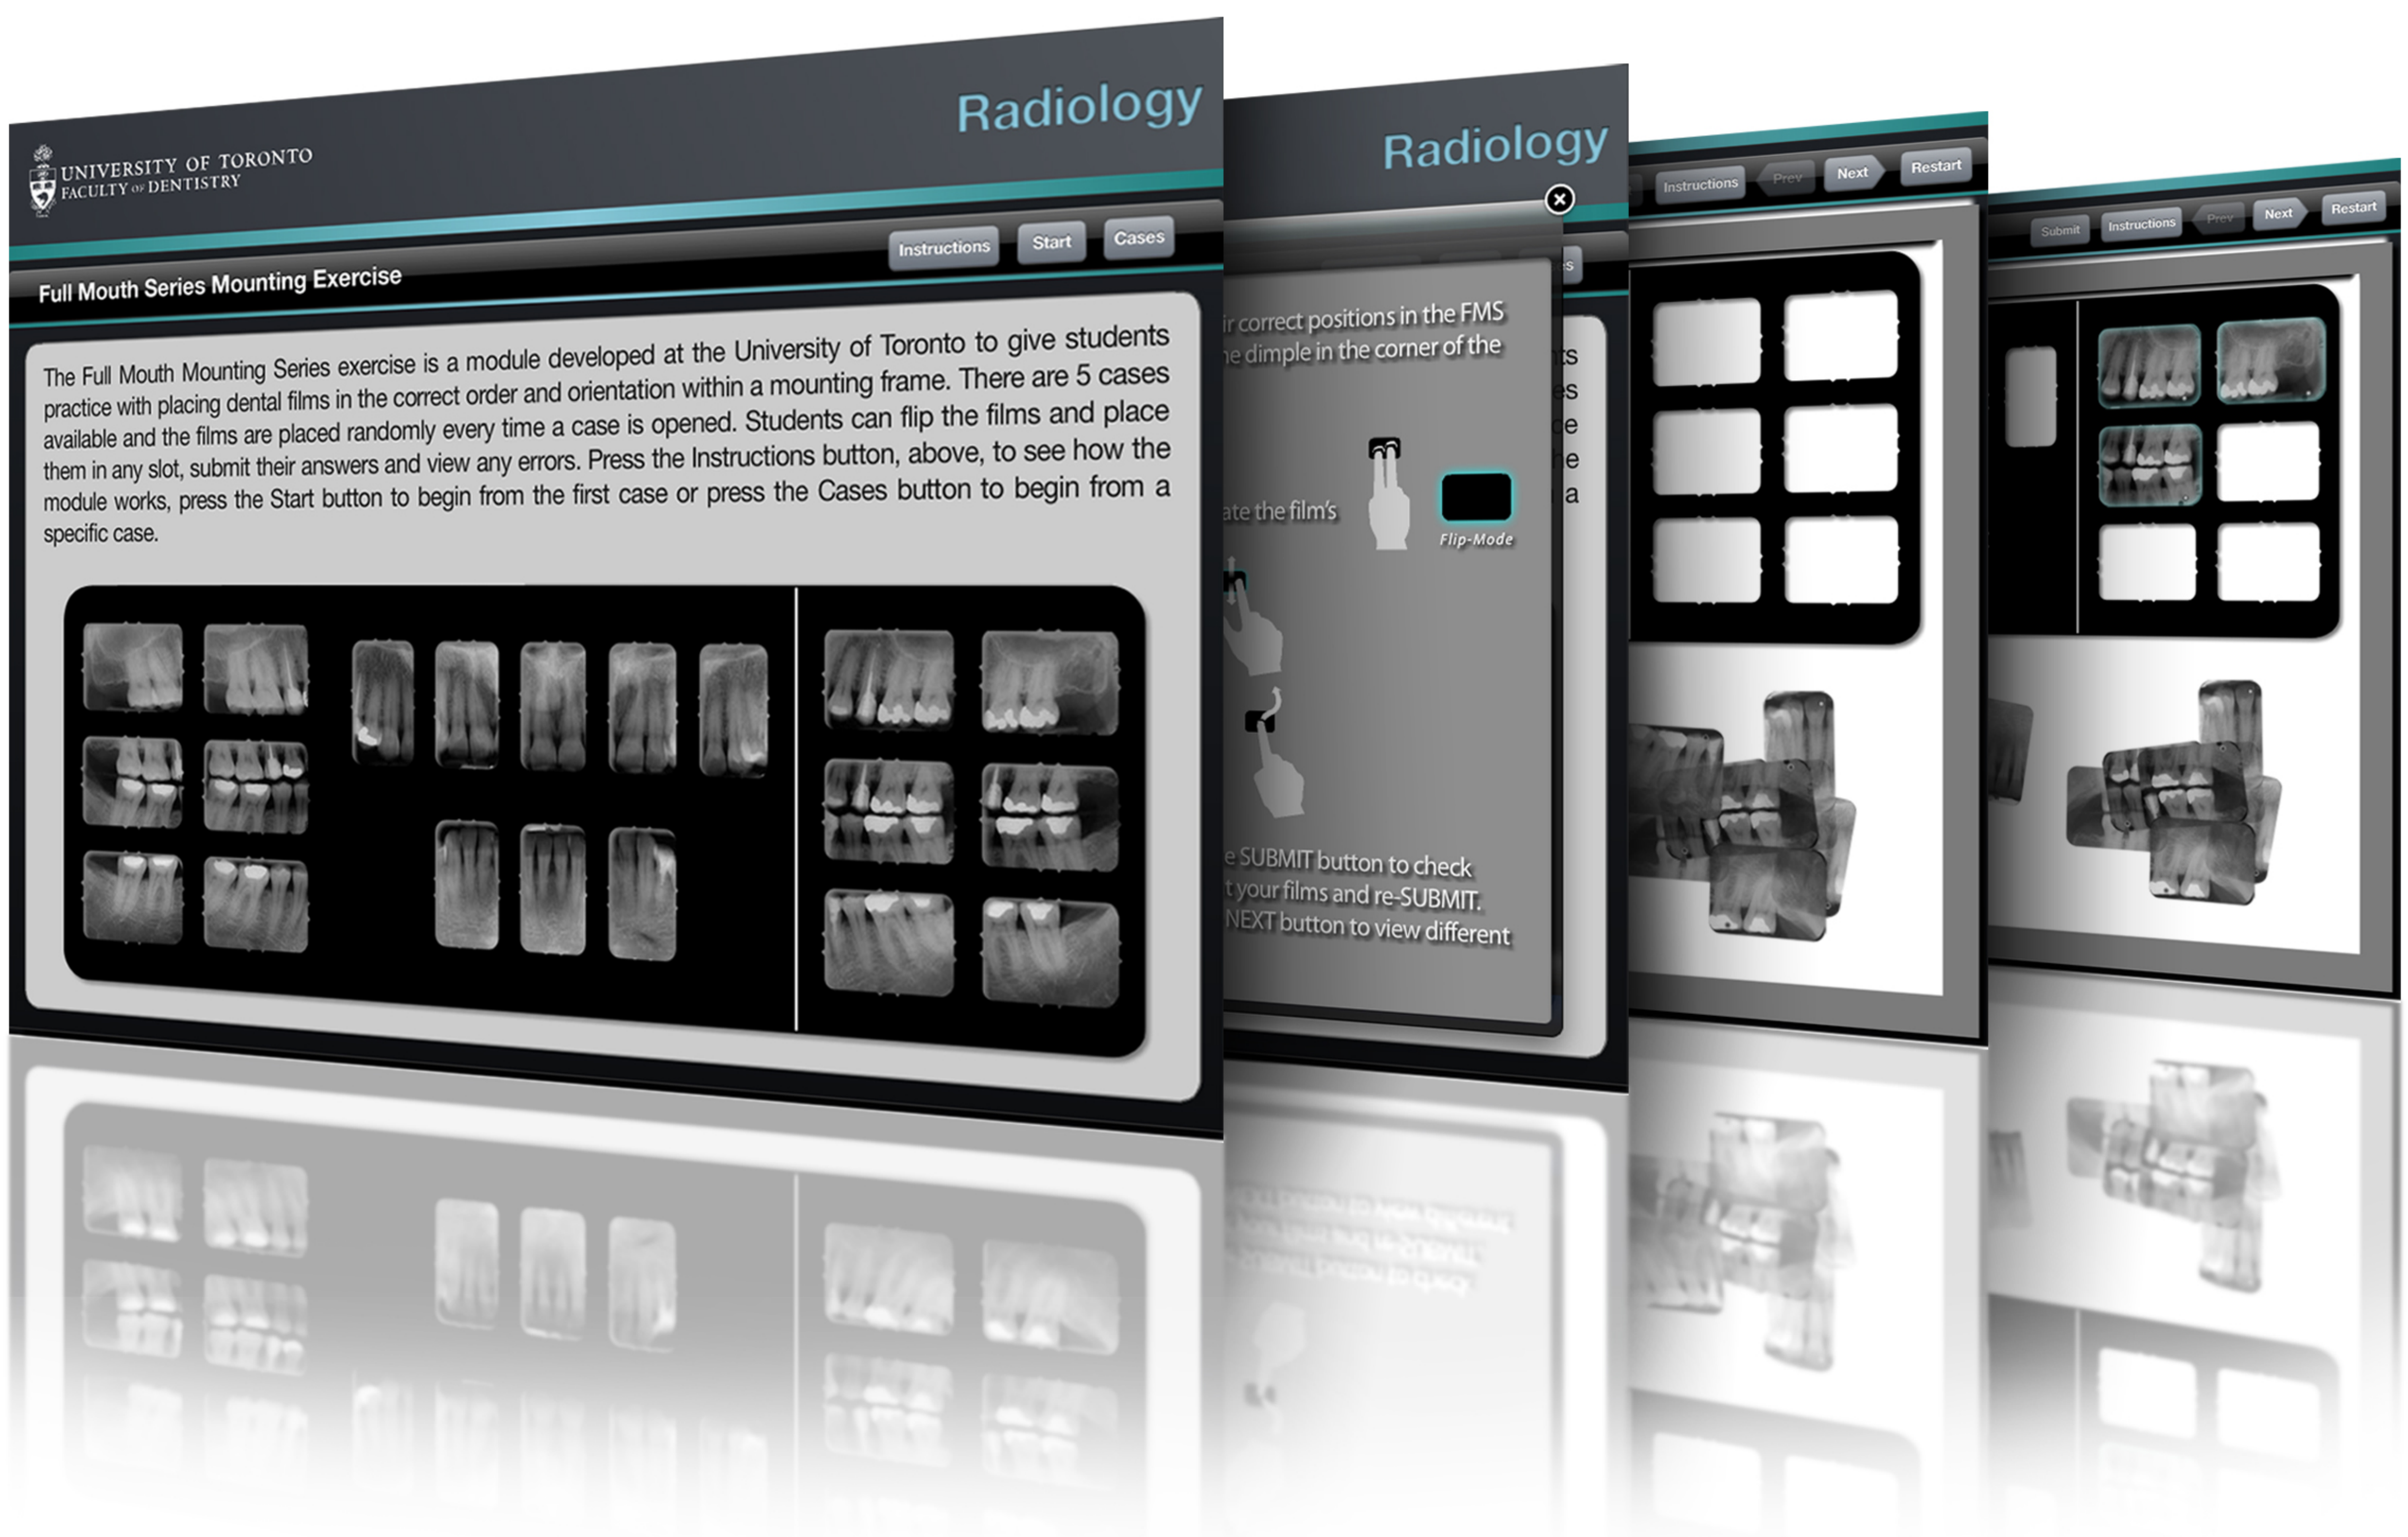

turned upside down and flipped over. This module does not teach the fundamentals of radiograph setup but provides the learner with the opportunity to practice these skills in a fun and engaging way. Challenge yourself to do it better and faster...or why not race a friend?!
